Workflow using zoho creator

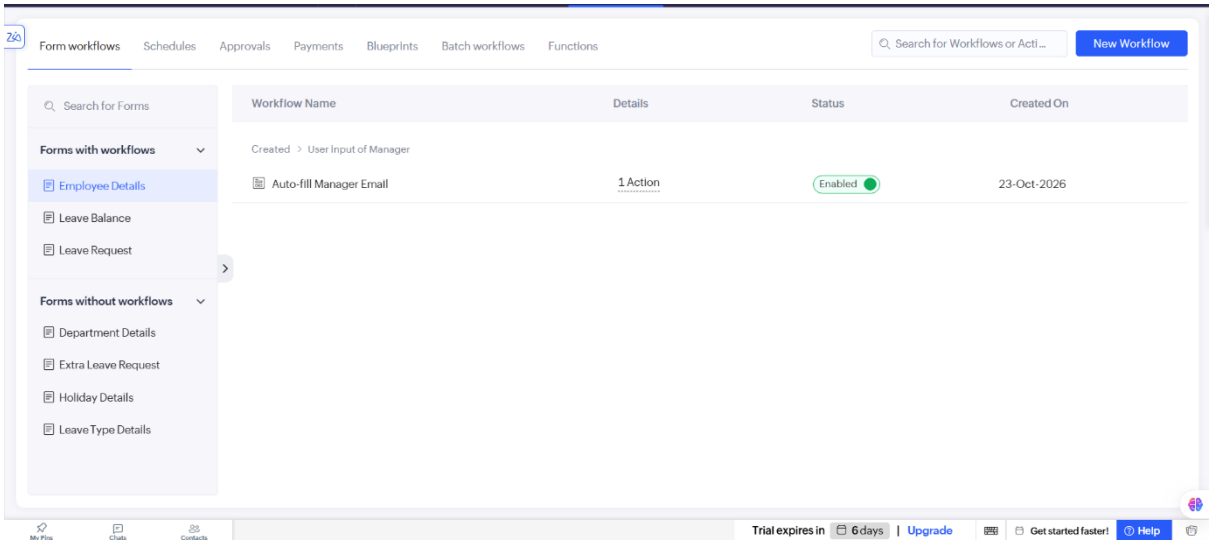

Aim:

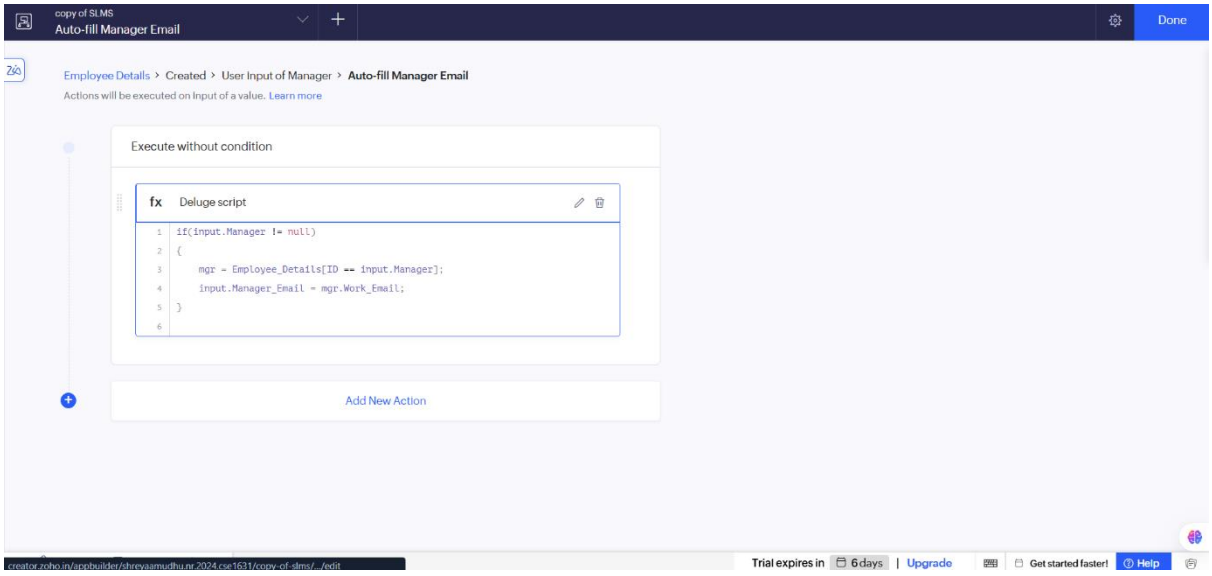

To create form workflows in Zoho Creator that validate a leave request against the employee's leave balance and automatically email the manager when a request is submitted.

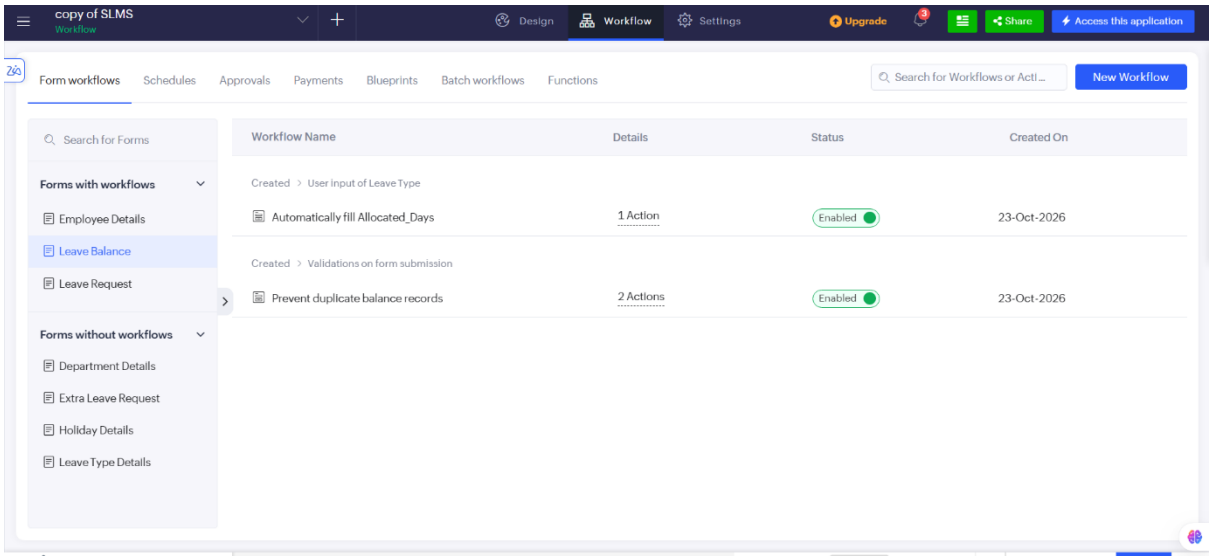

Procedure

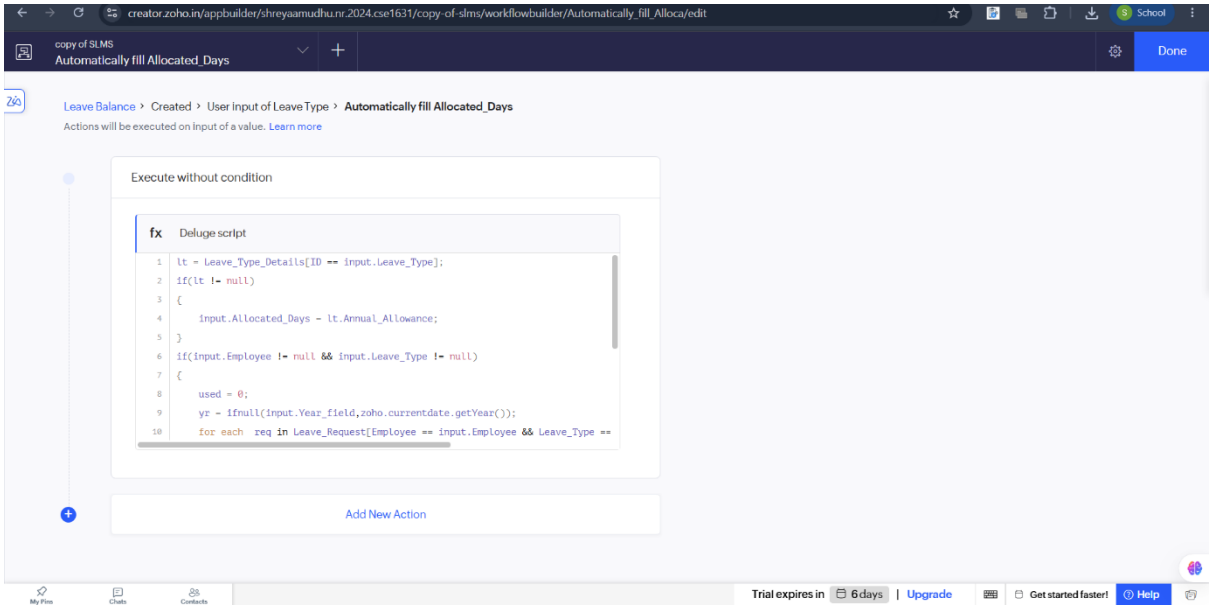

1. Open the SLMS application in Zoho Creator and go to Workflows → Form Workflow → Create New.
2. Name the first workflow "Calculate days and validate". Select the form Leave Request, set the record event to Create (On Add) and the trigger to On Validate.
3. Add a Deluge script that fetches the matching Leave_Balance record by Employee, Leave Type and Year. If no record exists, or Total_Days is greater than Remaining_Days, show an alert and run cancel submit;.
4. Save the workflow. It stops invalid requests before they are stored.
5. Create the second workflow, "Email the manager on submit". Select the form Leave Request, set the record event to Create and the trigger to On Success.
6. Add a Deluge script that fetches the employee from Employee_Details and uses sendmail to send the employee name, start date, end date, total days and reason to Manager_Email.
7. Save and open the app in Access mode. Submit a leave request with more days than the balance allows, then submit a valid one.
8. Check that the invalid request is blocked with an alert and that the manager receives an email for the valid one.

Screenshots:

Result:

The form workflows were created and tested successfully. Leave requests that exceed the available balance are rejected with an alert. Valid requests are saved, and the manager is notified by email automatically.
